Abstract

Objectives: This report presents the overall mortality pattern and by cause of death in the population resident in Spain, by sex, age and autonomous community of residence in 2010. The evolution of mortality due to the main causes of death and the evolution of child mortality are presented.

Methods: The data for producing this report come from the files of deaths by cause of death produced annually by the National Statistical Institute. These files were made based on the information provided by statistical death bulletins completed by family members, public registry officials and physicians at the time that the physician certifies the cause of death. The causes of death in those files have been coded according to the International Classification of Diseases.

Results: In 2010, 382,047 deaths occurred in Spain, representing a crude mortality rate of 829.2 deaths per 100,000 population. The age-adjusted mortality rate in 2010 was 487.0 deaths per 100,000 inhabitants of the standard European population. This represents a rate of 3.3% less than in 2009 and 39.5% less than in 1981. The age-adjusted mortality rate in 2010 was 78% higher in men than women. Between 2009 and 2010, age-specific mortality decreased in all age groups, with the 15 to 24 years group, which experienced a greater decrease at 12.0%. Three fifths of all deaths are due to the four leading causes of death: cancer, heart disease, cerebrovascular disease and chronic lower respiratory tract diseases. The infant mortality rate in 2010 was 3.2 deaths per 1,000 live births, 1.8% less than in 2009 and 21.7% lower than in 2001.

Conclusions: The mortality pattern in 2010 shows that the age-adjusted mortality rate continues to decline and cancer and heart disease remain the two leading causes of death.

Main findings

- In 2010, 382,047 deaths occurred in Spain, representing a crude mortality rate of 829.2 deaths per 100,000 population.
- The trend in risk of mortality, estimated on the basis of the trend in the age-adjusted mortality rates, showed a decrease of 3.3% between 2009 and 2010 and a decrease of 39.5% between 1981 and 2010.
- The age-adjusted mortality rate of 2010 was 78% higher in men than in women.
- The 15 leading causes of death in 2010 according to the number of deaths were:
 - Cancer
 - Heart diseases
 - Cerebrovascular diseases
 - Chronic lower respiratory tract diseases
 - Alzheimer's disease
 - Unintentional accidents
 - Diabetes mellitus
 - Pneumonia and influenza
 - Nephritis, nephrosis, and nephrotic syndrome
 - Hypertensive disease
 - Chronic liver disease and liver cirrhosis
 - Suicide
 - Parkinson's disease
 - Septicemia
 - Intestinal vascular disease
- Almost 60% of deaths are due to the four leading causes of death.
- Between 2001 and 2010, only 3 of the 15 leading causes of death showed an upward trend in the age-adjusted mortality rate: Alzheimer's disease, hypertensive disease and Parkinson's disease. In other leading causes of death, mortality showed a downward trend. Between 2009 and 2010 only

hypertensive disease showed an increase in the age-adjusted mortality rate.

- Men have a higher age-adjusted mortality rate than women in 13 of the 15 leading causes of death. Only the age-adjusted mortality rate by Alzheimer's disease was higher for women than for men, while the hypertensive disease rate showed a very similar size in both sexes.
- Between 2001 and 2010, the age-adjusted mortality rate for the causes of death attributable to smoking fell 11.8% in men and rose 57.1% in women. On the other hand, the age-adjusted mortality rate for causes of death attributable to alcohol consumption remained steady.
- The infant mortality rate in 2010 was 3.2 deaths in children younger than 1 year per 1,000 live births, representing a decrease of 21.7% with respect to 2001.
- The 10 leading causes of death in 2010 according to the number of deaths were:
 - Congenital malformations, deformities, and chromosomal abnormalities
 - Hemorrhage of the newborn
 - Bacterial sepsis of the newborn
 - Intrauterine hypoxia and asphyxia at birth
 - Respiratory distress syndrome of the newborn
 - Sudden infant death syndrome
 - Disorders related to short gestation period and low birth weight
 - Fetus and newborn affected by maternal complications of pregnancy
 - Necrotizing enterocolitis of the fetus and the newborn
 - Fetus and newborn affected by complications of the placenta and membranes

Introduction

This report presents the 2010 data on deaths and mortality rates according to various demographic and geographical characteristics in Spain. Specifically, it provides information on the overall mortality pattern and by cause of death in the population resident in Spain according to sex, age and autonomous community of residence. It also presents the trend in mortality by the leading causes of death and the trend in infant mortality.

Mortality data are frequently used for assessment of the health status of populations (1-2) because the estimates based on them are those presenting a higher degree of validity for geographical and temporal comparisons of health level. The exhaustiveness of the information provided by the mortality registry and objectivity of the phenomenon it contains make mortality indicators, such as life expectancy or mortality by cause of death, a suitable instrument for monitoring health problems and setting health priorities. According to the World Health Organization (WHO), only mortality indicators have a adequate level of confidence to compare the level of health between different countries, given the limitations shown by other health statistics for performing comparisons. Furthermore, the information it provides on the mortality pattern for various causes of death is the only way to estimate the population impact of many diseases.

Methods

The data in this report are based on the information from statistical death bulletins of the deceased resident in Spain. The information in those bulletins is completed by family members, public registry officials

and physicians at the same time as the physician certifies the cause of death. The statistics by cause of death are classified according to the International Classification of Diseases, 10th revision. However, the International Classification of Diseases, 9th revision, was also used to identify before 1999 the 15 causes of death that produced the most deaths in 2010. In fact, given that the International Classification of Diseases, 10th revision came into effect in 1999 to study the tendency in mortality due to these 15 causes of death since 1981, it was necessary to use the International Classification of Diseases, 9th revision, which was used to encode the causes of death between 1981 and 1998. To select and group the main causes of death the criterion used by the Atlanta Centers for the Disease Control and Prevention were followed. A commentary on the classification of causes of death appear in the appendix on data sources and explanatory notes.

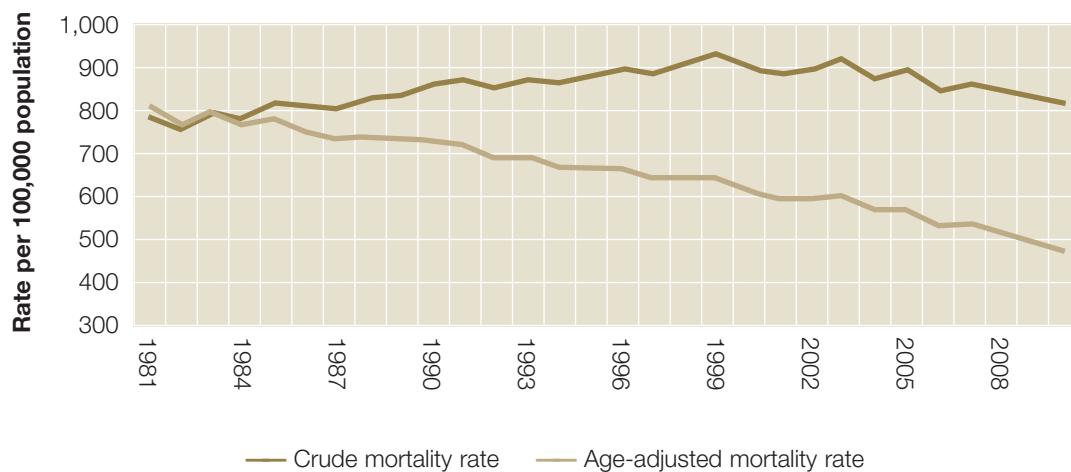

The measures of mortality in this report include the number of deaths, gross or crude mortality rate, age-specific mortality rate,

age-adjusted mortality rate, infant mortality rate, neonatal and postneonatal mortality rate. In addition, in the age-specific overall mortality rates and age-adjusted mortality rates for the 15 leading causes of death, the change in the rates between 2009 and 2010 and over the last decade (since 2001) are presented.

The number of deaths was taken from the file on deaths by cause of death, provided annually by the National Statistical Institute (INE) to the Department of Health Information of the Ministry of Health, Social Services and Equality.

The appendix on data sources and explanatory notes explains how data on deaths contained in the file is obtained. The populations used for calculation of mortality rates come from Spanish Population Projections for the period 1980-2010 from the 1981 Population Census (years 1981 to 1990), from the Spanish Population Projections calculated from the 1991 Population Census (from 1991 to 2001) and from the Current Population Estimates (from 2002 to 2010), all of them prepared by the INE.

Figure 1. Crude and age-adjusted mortality rates. Spain 1981-2010

Results and Discussion

Deaths and mortality rates

In 2010 there were 382,047 deaths in Spain. This represents 2,886 fewer deaths than in 2009. This number of deaths is very similar to deaths occurring in the last five years, with a median of 384,933. The crude mortality rate in 2010 was 829.2 deaths per 100,000 inhabitants, which is 1.1% less than the 2009 rate. This crud mortality rate is the lowest since 1989, which had a mortality rate of 835.2 per 100,000 inhabitants (Table 1).

The age-adjusted mortality rate in 2010 was 4870 deaths per 100,000 population of the standard population, which represents a very low value with respect to previous years. The rate was 3.3% less than in 2009, in which the rate was 503.7, and 39.5% less than in 1981, in which the rate was 804.8 (Figure 1). The age-adjusted mortality rate in Spain is the lowest in the countries of the European Union, together with those observed in Italy and France. This explains why these three countries are the ones with highest life expectancy of the European Union (4).

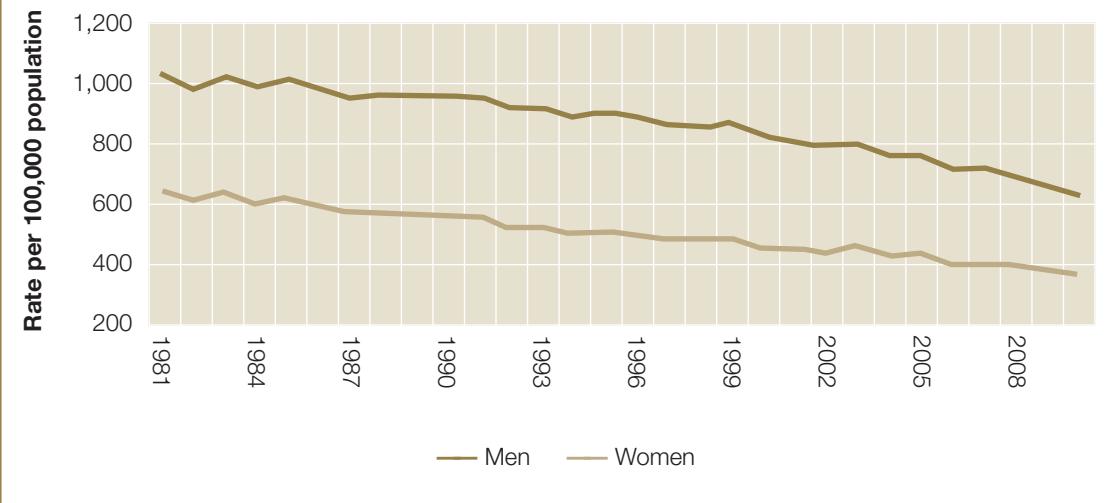

The age-adjusted mortality rate is a theoretical rate that shows what mortality would be if no changes had occurred in the age composition of the population from year to year. A commentary on age-adjusted mortality rates and how to calculate them may be read in the appendix on data sources

and explanatory notes. Thus, age-adjusted mortality rates are better indicators than gross or crude mortality rates to assess the change in the risk of mortality over time, since the distribution by age of the population changes. Likewise, the age-adjusted mortality rates are better indicators when the risk of mortality is compared between different geographic areas or between population subgroups with different age structure, like that seen between men and women. For example, whereas in 2010 the crude mortality rate in men was 11% higher than the crude mortality rate in women, the age-adjusted mortality rate was 78% higher in men than in women. In the countries of the European Union, the excess age-adjusted mortality rate in men with respect to women ranges from 45% to 110% (4).

Between 2009 and 2010, the age-adjusted mortality rate was 3.0% men and 3.6% women. Since 1981 the rate shows a downward trend in both sexes (Figure 2). In men it dropped from 1022.6 in 1981 to 641.3 in 2010 and in women it fell from 636.2 in 1981 to 361.1 in 2010, representing a decrease of 37.3% for men and 43.1% for women.

During this period the lowest difference in age-adjusted mortality rates in men and women was observed in 1981 and the greatest in 2001. The age-adjusted mortality rate in men was higher than that in women at 61% in 1981 and 82% in 2001.

Figure 2. Age-adjusted mortality rate in men and women. Spain 1981-2010

Age and sex-specific mortality rates

As in most developed countries, the lowest age-specific mortality rate is observed in the 5 to 14 years age group, as shown in Table I. In 2010, the size of the mortality rate in that age group was 9.6 per 100,000 population. The mortality rate in children under one year of age and in the 1 to 4 years age group was, respectively, 306.9 and 18.1 per 100,000 population.

Likewise, starting from the 5 to 14 years age group, the size of the mortality rate experiences an increase in subsequent age groups, so that in the group aged 85 years and over the rate was 13,794.6 per 100,000 population. In each 10-year age group, the mortality rate almost doubles with respect to the previous group, except in the 75 to 84 years age group, where the rate is three times higher than the rate of the 65 to 74 years age group (Table 2 and Table I).

In all age groups, the size of the mortality rate was higher in men than in women. The ratio between the mortality rate in men and

in women in 2010 showed the highest size in the 55 to 64 years age group and the lowest size in the group of children under 1 year. In the 55 to 64 years age group, the mortality rate was 2.58 times higher in men than in women, while in the group of children under 1, the mortality rate was only 1.08 times higher in men than in women.

Table II shows that age-specific mortality rates fell across all age groups between 2009 and 2010. The greatest drop was observed in the 15-24 years, 1-4 years and 25-44 years groups, with a fall of 11.9%, 11.5% and 11.1%, respectively. The smallest reduction was seen in the 55 to 64 years age group, with 1.9% decrease, and in the 85 years plus group, with a decline of 2.5%. Between 2001 and 2010, the largest decline in mortality rates was seen in the 25 to 34 years and 15 to 24 years age groups, with a reduction of 46.4% and 44.8%, respectively. In turn, the smallest decline between 2001 and 2010 in mortality rates was seen in the 85 years and over age group and in the 55 to 64 years age group, with a decline of 12.0% and 14.6%, respectively.

Table I. Mortality rate per 100,000 population by age. Spain, 2010

Age	Mortality rate			Ratio between mortality rate in men and women
	Both sexes	Men	Women	
All ages				
Crude	829.2	872.9	786.8	1.11
Age-adjusted	487.0	641.3	361.1	1.78
Under 1 year ¹	306.9	318.5	294.5	1.08
1-4 years	18.1	18.8	17.3	1.09
5-14 years	9.6	11.4	7.7	1.48
15-24 years	27.5	38.5	15.9	2.43
25-34 years	40.6	56.0	24.4	2.29
35-44 years	96.6	126.8	64.9	1.95
45-54 years	269.7	372.4	168.0	2.22
55-64 years	604.3	879.6	345.2	2.55
65-74 years	1,389.9	2,011.2	853.1	2.36
75-84 years	4,187.6	5,578.4	3,213.5	1.74
85 years and over	13,794.6	15,319.4	13,058.9	1.17

¹ The mortality rate in children under 1 year is not the same as the infant mortality rate; the denominator in the infant mortality rate refers to the number of live births, whereas the denominator here refers to the number of children under 1 year of age

The high decline in mortality rate in 15 to 24 years and 25 to 34 years age groups very likely reflects the spectacular decline in mortality from unintentional accidents since 2001, and chiefly from traffic accidents, because it is the main cause of death in this age group.

Indeed, the number of traffic accident deaths in the 15 to 24 years age group was reduced to a third between 2001 and 2010: from 1215 deaths for this cause in 2001 to 311 deaths in 2010 (5). And a similar situation occurred in the 25 to 34 years age group, given that the number of deaths in that interval dropped to less than half: from 1,147 deaths in 2001 to 410 in 2010. In turn, the smallest decline in mortality rate in the

55 to 64 group years reflects especially the low mortality from cancer: between 2001 and 2010 the decline was about 9%. Furthermore, in women, mortality from respiratory tract diseases, which remained almost steady in the period considered, also contributed to the decline. (6).

Between 1981 and 2010, the largest decline in mortality rate was seen in the children under 1 and 1 to 4 years age groups, with a decline of 74.6% and 71.1%, respectively. Another population group with a large drop in mortality was the 5 to 14 years age group, where the rate fell by 67.6%. The smallest decline in mortality between 1981 and 2010 was seen in the 85 years and over age group, where the reduction was 24%.

Table II. Percent change in age-specific mortality rate in 2009-2010 and 2001-2010.

Age	Percent change in 2009-2010			Percent change in 2001-2010		
	Both sexes	Men	Women	Both sexes	Men	Women
All ages						
Crude	-1.1	-0.6	-1.5	-6.2	-8.2	-4.1
Age-adjusted	-3.3	-3.0	-3.6	-18.3	-19.2	-17.4
Under 1 year, ¹	-3.8	-7.3	0.4	-25.2	-28.2	-21.4
1-4 years	-11.5	-16.0	-5.7	-26.5	-33.7	-16.1
5-14 years	-3.4	-0.9	-7.2	-36.0	-34.3	-38.3
15-24 years	-11.9	-8.5	-19.2	-44.8	-47.7	-35.6
25-34 years	-11.1	-11.8	-8.5	-46.4	-48.8	-40.5
35-44 years	-5.5	-5.8	-4.8	-34.2	-38.7	-24.7
45-54 years	-2.3	-1.1	-4.8	-15.2	-17.7	-9.6
55-64 years	-1.9	-2.5	-0.3	14.6	-15.9	-11.3
65-74 years	-4.5	-4.2	-5.2	-22.3	-21.6	-24.8
75-84 years	-3.6	-2.9	-4.6	-16.2	-14.9	-19.2
85 years and over	-2.5	-1.7	-3.0	-12.0	-13.8	-11.5

¹ It does not refer to the infant mortality rate in children under 1 year of age, because the denominator in the infant mortality rate is live births and here the denominator is residents aged 1 year.

Leading causes of death

The 15 leading causes of death in 2010 caused slightly more than three quarters of all deaths in Spain; specifically 77.0% of the total. Three fifths of all deaths are due to the four leading causes of death.

The 15 leading causes of death in 2010 according to the number of deaths were: 1st) cancer, 2nd) heart disease, 3rd) cerebrovascular disease, 4th) chronic lower

respiratory tract diseases, 5th) Alzheimer's disease, 6th) unintentional accidents, 7th) diabetes mellitus, 8th) pneumonia and influenza, 9th) nephritis, nephrosis and nephrotic syndrome, 10th) hypertensive disease, 11th) chronic liver disease and liver cirrhosis, 12th) suicide, 13th) Parkinson's disease, 14th) septicemia, and 15th) intestinal vascular disease. The number of deaths and mortality rate from these causes are shown in Table III and in Table 3.

Table III. Leading causes of death in Spain in 2010. Number of deaths, percentage of total number of deaths, and crude mortality rate per 100,000 population by cause of death.

Rank ¹	Cause of death (based on the International Classification of Diseases, 10th revision)		Number of deaths	Percentage of all deaths	Crude mortality rate
---	All causes		382,047	100.0	829.2
1	Cancer	C00-C97	103,307	27.0	224.2

14	Septicemia	A40-A41	2,816	0.7	6.1
15	Intestinal vascular disease	K55	2,761	0.7	6.0
---	Other causes		87,836	23.0	190.6

¹ Range based on the number of deaths

Changes in the population age structure may lead to changes in the gross or crude mortality rate by cause of death. Furthermore, these changes may be of greater size in some causes than in others depending on the mortality pattern by age in each cause of death. However, the age-adjusted mortality rate eliminates the influence of these changes in the population age structure.

This is why the age-adjusted mortality rates are better indicators than crude mortality rates to show the changes in

mortality by cause of death over time. Therefore, the age-adjusted mortality rates are used to describe the trend in mortality from the leading causes of death.

The fact that mortality patterns by age are different from some causes to others explains why in some causes of death the age-adjusted mortality rate is greater in size than in others, even though the number of deaths in the former is less than the number of deaths in the latter. In general terms, this is due to the fact that mortality at young ages is higher in the former case than in the latter.

Table IV. Leading causes of death in Spain in 2010. Age-adjusted mortality rate per 100,000 population in 2010 and percent change in 2009-2010 and 2001-2010 by cause of death.

Range ¹	Cause of death (based on the International Classification of Diseases, 10th revision)	Age-adjusted mortality rate 2010	Percent change in 2009-2010	Percent change in 2001-2010
---	All causes	487.0	-3.3	-18.3
1	Cancer C00-C97	152.3	-0.4	-11.0
2	Heart diseases I00-I09,I11, I13, I20-I51	91.6	-3.0	-24.0
3	Cerebrovascular diseases I60-I69	33.8	-6.5	-38.0

13	Parkinson's disease G20-G21	3.3	-0.7	19.5
14	Septicemia A40-A41	3.3	-16.2	-21.1
15	Intestinal vascular disease K55	3.1	-7.2	-14.5

¹ Range based on the number of deaths

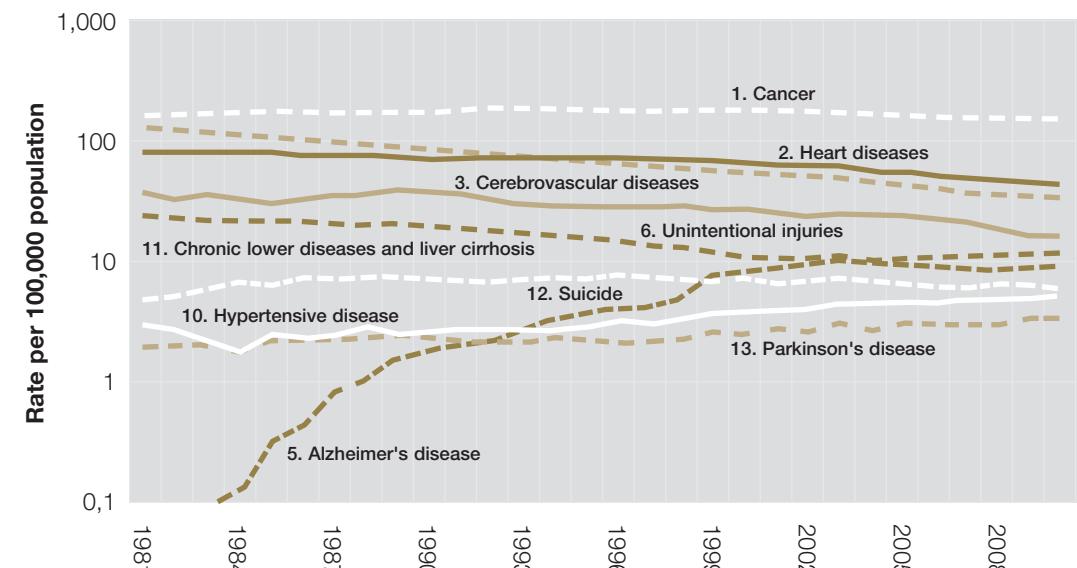

Between 2009 and 2010, the age-adjusted mortality rate for all the causes of death declined by 3.3%. This decline in the risk of death may be due mainly to the reduction in the risk of death from heart diseases, cerebrovascular diseases, chronic lower respiratory tract disease, and unintentional accidents.

Table IV shows that in 14 of the 15 main causes of death, the age-adjusted mortality rate fell in 2010 compared to 2009. The sole cause of death in which the age-adjusted mortality rate increased was in hypertensive disease. Of special interest is the very slight drop in mortality due to cancer, at a 0.4 per cent (%). Between 2001 and 2010 only 3 of

the 15 main causes of death showed an upward trend in the age-adjusted mortality rate: Alzheimer's disease, hypertensive disease and Parkinson's disease.

Between 1981 and 2010, the age-adjusted mortality rate shows a downward trend, except for Alzheimer's disease, hypertensive disease, intestinal vascular disease, and Parkinson's disease (Figure 3). The most spectacular rise was in Alzheimer's disease, since in 1981 only 21 deaths occurred from this illness, while 11,343 occurred in 2010. These figures assume the age-adjusted mortality rate changed from 0.05 per 100,000 population in 1981 to 1146 per 100,000 population in 2010.

Figure 3. Age-adjusted mortality rate for selected leading causes of death. Spain, 1981-2010

Ongoing reduction of mortality from transmissible diseases throughout the 20th century in developed countries has meant that non-transmissible diseases and accidents have become the leading causes of death (7). Specifically, in the last decade of the last century around 85% of deaths in those countries were caused by non-transmissible diseases, and among them, three quarters were due to cardiovascular diseases and cancer (8). This preponderance of non-transmissible diseases contrasts with the downward trend that has been observed in most diseases in the last third of the last century. Thus, the reduction in mortality from cardiovascular diseases starting at the end of 1960s in some countries and over the 1970s in others (9-11) has been added to the reduction in mortality from cancer in the 1990s (12-14). Similarly, mortality from other chronic diseases, such as chronic

obstructive pulmonary disease–chronic lower respiratory tract diseases–, diabetes mellitus or chronic liver disease and liver cirrhosis, has experienced a decline since the last decade of the last century in these countries (4, 15-16).

Nevertheless, although presumably the risk of mortality from these non-transmissible disorders will continue to decline in developed countries, the disease burden they cause might not decrease in the same way or even remain steady, because most appear in advanced ages and the population of these age groups is increasing. For example, in the Spanish population aged over 74 years, deaths from cancer in 1981 represented 31% of all deaths for this cause of death, while in 2010 this percentage was 51%. Likewise, all deaths due to heart conditions, in this age group this was 55% in 1981, but 79% in 2010. These percentages in

1981 and 2010 were 66% and 83%, respectively, for cardiovascular diseases. It may be said that gradual population ageing as a result of the reduction in mortality and the consequent increase in life expectancy is the main cause for the importance of these diseases.

Of the 15 leading causes of death that have been observed in Spain, 14 are similar to those observed in the United States (16). In that country, pneumonitis due to solids and liquids rather than intestinal vascular disease occurs. In addition, the hierarchical order is similar, with the exception of heart diseases, which are the second leading cause of death in Spain but the leading cause of death in the United States. In Spain, as in other countries of the European Union, mortality from cancer is the leading cause of death: This is the case in France, Italy, the Netherlands, or Belgium. On the other hand, in other countries of the European Union heart diseases are the leading cause of death (17). This is due to the fact that in many countries the mortality rate from ischemic heart disease, representing the leading cause of death among heart diseases, has a relatively large size: This is the case in Sweden, Germany, Finland, and especially the countries of Eastern Europe (17).

As noted, one of the most relevant findings of this report was the impact on mortality of Alzheimer's disease, not only because it is the fifth-leading cause of death, but because of the spectacular growth seen in mortality since 1981. Something similar

has occurred in other countries (16). At least two factors could be indicated as responsible for this increase in mortality from Alzheimer's disease. First, an increase in the incidence and/or the prevalence of the disease.

And, secondly, increased sensitivity of physicians to this disease, which would have led them to diagnose cognitive impairments such as Alzheimer's disease more often than in the past, or to note more precisely this disease as the basic cause of death in death certificates. However, it should be pointed out that 2010 was the first year in which the age-adjusted mortality rate for this disease fell.

The excess in the risk of mortality in one population group compared to another may be expressed by the ratio. The ratio of age-adjusted mortality rates in men versus women shows that men higher rates than women in 13 of the 15 causes of death, as shown in Table V.

Only the age-adjusted mortality rate for Alzheimer's disease was higher in women than in men (rate ratio of 0.76), while the hypertensive disease rate showed a very similar size in both sexes (rate ratio of 1.02). The greatest differences in the age-adjusted mortality rates between men and women in 2010 was seen in chronic lower respiratory tract diseases (rate ratio of 4.70), suicide (rate ratio of 3.77), in chronic liver disease and liver cirrhosis (rate ratio of 3.44), unintentional accidents (rate ratio of 2.77) and cancer (rate ratio of 2.14).

Table V. Leading causes of death in Spain in 2010. Ratio between age-adjusted mortality rate in men and women in 2010 and 2001 by cause of death.

Range ¹	Cause of death (based on the International Classification of Diseases, 10th revision)	Ratio between mortality rate in men and women	
		2010	2001
---	All causes	1.78	1.81
1	Cancer	C00-C97	2.14

15	Intestinal vascular disease	K55	1.35

¹ Range based on the number of deaths

Mortality and tobacco

The total number of deaths for all the causes of death that have shown a relation to smoking is an indicator used by WHO to monitor deaths related to tobacco use (4). The appendix on data sources and explanatory notes includes the causes of death included in this indicator. According to this indicator, in 2010 there were 107,451 deaths related to smoking in Spain and the age-adjusted mortality rate for these causes of death experienced a reduction of 25.3% in

men and 27.8% in women between 2001 and 2010 (Table 7). However, this indicator overestimates the importance of this risk factor in mortality and hinders the identification of the trend of the causes of death more closely related to tobacco use.

Therefore, this report has also prepared an indicator that only takes into account deaths from lung cancer, since 90% these deaths are due to smoking. It is an indicator that underestimates deaths related to tobacco, but it is more sensitive to the trend experienced by those deaths. Indeed, deaths

for the cause of death can be designated as attributable to tobacco use. Specifically, in 2010 there were 20,755 deaths from lung cancer, representing 330 deaths more than in 2009 (Table 8).

The change in age-adjusted mortality rates shows a different trend in men and women. Between 2001 and 2010, the age-adjusted mortality rate for the causes of death attributable to smoking fell 11.8% in men but rose 57.1% in women. This increase in mortality from lung cancer that has been observed in women is a reflection of the late incorporation to tobacco use, while the decline in tobacco use in men observed for some time has resulted in a drop in mortality from lung cancer. As a result of this different trend, the age-adjusted mortality rate went from being 10 times higher in men than in women by 2001 to 5.7 times higher in 2010.

Mortality and alcohol

As occurs with smoking, the total number of deaths for all the causes of death that have shown a relation to alcohol use is an indicator used by WHO to monitor deaths relating to alcohol use (4). In 2010 there were 23,276 deaths related to alcohol use in Spain and the age-adjusted mortality rate for these causes of death experienced a reduction of 29.8% in men and 23.2% in women between 2001 and 2010 (Table 9). However, as occurs with smoking, this indicator overestimates the importance of this risk factor in mortality and does not adequately identify the trend of the those causes of death more closely related to alcohol use.

Therefore, this report has also prepared an indicator that only takes into account deaths directly attributable to alcohol use. Although it underestimates deaths related

to alcohol use, it is a more sensitive indicator to detect the trend of these deaths. Specifically, only causes of death in the International Classification of Diseases, 10th revision, appearing as due to alcohol have been included. The appendix on data sources and explanatory notes includes the causes of death that have been included. According to this indicator, the number of deaths attributable to alcohol in 2010 was 1,825, a figure slightly higher than the previous years (Table 10). In any case, the age-adjusted mortality rate in the last decade for these causes of death has remained practically steady and its size is around six times more in men than in women.

Mortality related to quality of the health system

Deaths for any of the causes of death may be regarded as sentinel indicators of the quality of the health system. In this report three of these indicators used by the World Health Organization were selected. These deaths are the deaths from abdominal hernia, appendicitis, and adverse effects of medicinal products (Tables 11, 12 and 13). In 2010 there were 2,397 deaths due to abdominal hernia, representing 140 more deaths than in 2009. Since 2001, when the number of deaths due to abdominal hernia was 1,722, a steady rise in the number of deaths due to this disease was seen. Whereas the number of deaths due to appendicitis has remained virtually stable in recent years – the median figure for the last five years is 66-. And, finally, the number of deaths from adverse drug effects has experienced a downward trend in the last decade: it reached a figure of 264 in 2003, but fell to 119 in 2008 and 2009 and to 136 in 2010.

Infant mortality

In 2010 there were 1,553 deaths in children aged under 1 year. This is 562 fewer deaths than in 2009. This figure is lower to the one for the last five years, with a median figure of exactly 1,704 deaths. The infant mortality rate in 2010 was 3.2 deaths per 1,000 live births, a similar figure to 2009 and 21.7% less than in 2001 (Table VI and Table 17).

From the start of the 20th century, the infant mortality rate has shown a downward trend in Spain and since 1940 the rate has decreased year after year.

The rate was below the average of the European Union, whose size in 2010 was 4.18 per 1,000 live births (4).

In 2010, the neonatal mortality rate was 2.1 deaths per 1,000 live births and the postneonatal mortality rate was 1.1 deaths per 1,000 live births. Since 2001, neonatal and postneonatal mortality rates have declined by 24.0% and 17.0%, respectively (Figure 4).

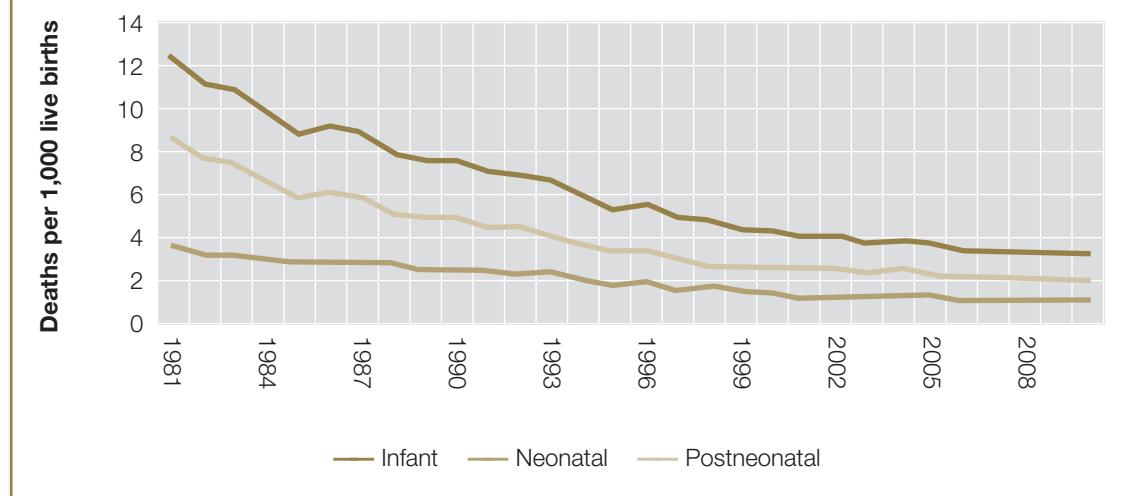

Table VII shows that the 10 leading causes of death in children in 2010 caused 60% of all deaths in children under 1 year of age in Spain. These 10 causes of death ordered according to the number of deaths are:

Table VI. Number of infant, neonatal and postneonatal deaths in Spain in 2010. Infant, neonatal and postneonatal mortality rate¹ and percent change in 2009-2010 and 2001-2010.

	Number	Rate	Rate	
			Percent change in 2009-2010	Percent change in 2001-2010
Infant	1,553	3.2	-1.8	-21.7
Neonatal	1,025	2.1	-0.9	-24.0
Postneonatal	528	1.1	-3.6	-17.0

¹ Rate per 1,000 live births

Figure 4. Infant, neonatal, and postneonatal mortality rates. Spain, 1981-2010

1st) congenital defects, deformities and chromosomal abnormalities, 2nd) hemorrhage of the newborn, 3rd) bacterial sepsis of the newborn, 4th) intrauterine hypoxia and asphyxia at birth, 5th) respiratory distress of the newborn, 6th) sudden infant death syndrome, 7th) disorders related to the short gestation period and low birth weight, 8th) fetus and newborn affected by maternal complications of pregnancy, 9th) necrotizing enterocolitis of the fetus and the newborn and 10th) fetus and newborn affected by complications of the placenta and membranes.

Most of the decline in infant mortality rate in this period is due to the decrease observed in the deaths from congenital malformations, deformities, and chromosomal abnormalities, as they represent a quarter of all deaths in children under 1 year of age. Namely, the

infant mortality rate due to this cause of death fell by 27.9% between 2001 and 2010. Of the remaining 10 causes of death, the drop in the rate of infant mortality due to disorders related to the short gestation period and low birth weight is noticeable as it fell by 55.5% between 2001 and 2010, and the fall in the infant mortality rate due to fetus and newborn affected by maternal complications of pregnancy and due to respiratory distress of the newborn, which fell, respectively, by 48.9% and 47.9% between 2001 and 2010, as shown in table VIII and table 19. Only one of the ten main causes of death in children aged under 1 year experienced an increase in the infant mortality rate between 2001 and 2010: necrotizing enterocolitis of the fetus and the newborn, although the rate was lower in 2010 than in 2009.

Table VII. Leading causes of death in children under 1 year in Spain in 2010. Number of deaths, percentage of total deaths and infant mortality rate¹ by cause of death.

Range ²	Cause of death (based on the International Classification of Diseases, 10th revision)	Number of deaths	Percentage of total deaths	Rate

Table 18. Number of deaths in children under 1 year and infant mortality rate by cause of death, Spain 2010.

Cause of death (based on the ICD, 10th revision)		Deaths	Rate
All causes		1,553	319.2
Infectious and parasitic diseases	A00-B99	21	4.3
Diarrhea and infectious gastroenteritis	A09	1	0.2
Whooping cough	A37	3	0.6
Meningococcal disease	A39	1	0.2
Septicemia	A40-A41	10	2.1
Malignant neoplasms	C00-D48	16	3.3
Diseases of the blood and blood-forming organs and certain disorders involving the immune mechanism	D50-D89	9	1.8
Endocrine, nutritional and metabolic diseases	E00-E90	36	7.4
Diseases of the nervous system	G00-G99	55	11.3
Meningitis	G00, G03	5	1.0
Spinal muscular atrophy and related syndromes	G12	21	4.3
Diseases of the myoneural junction and muscle	G70-G72	8	1.6
Diseases of the circulatory system	I00-I99	19	3.9
Cardiomyopathy	I42	5	1.0
Pulmonary heart disease and diseases of pulmonary circulation	I26-I28	2	0.4
Diseases of the respiratory system	J00-J99	23	4.7
Pneumonia and influenza	J10-J18	4	0.8
Bronchitis and acute bronchiolitis	J20-J21	9	1.8
Diseases of the digestive system	K00-K93	6	1.2
Hernia of the abdominal cavity and intestinal obstruction without hernia	K40-K46, K56	2	0.4
Diseases of the genitourinary system	N00-N99	4	0.8
Certain conditions originating in the perinatal period	P00-P96	807	165.9
Fetus and newborn affected by maternal complications of pregnancy	P01	47	9.7
Fetus and newborn affected by complications of the placenta, umbilical cord and membranes	P02	36	7.4
Disorders related to short gestation period and low birth weight, not classified elsewhere	P07	50	10.3
Intrauterine hypoxia and asphyxia at birth	P20-P21	59	12.1
Respiratory distress syndrome of the newborn	P22	58	11.9
Neonatal aspiration syndromes	P24	13	2.7
Interstitial emphysema and related condition originating in the perinatal period	P25	13	2.7
Pulmonary hemorrhage originating in the perinatal period	P26	23	4.7
Chronic respiratory disease originating in the perinatal period	P27	25	5.1
Primary atelectasis of the newborn	P28.0-P28.1	22	4.5

Table 18. Number of deaths in children under 1 year and infant mortality rate by cause of death, Spain 2010. (Continuation)

Cause of death (based on the ICD, 10th revision)		Deaths	Rate
Cardiovascular disorders originating in the perinatal period	P29	39	8.0
Bacterial sepsis of the newborn	P36	80	16.4
Hemorrhage of the newborn	P50-P52, P54	82	16.9
Hematological disorders of the newborn	P60-P61	8	1.6
Necrotizing enterocolitis of the fetus and the newborn	P77	40	8.2
Congenital malformations, deformities, and chromosomal abnormalities	Q00-Q99	434	89.2
Anencephaly and similar congenital malformations	Q00	4	0.8
Congenital hydrocephalus	Q03	5	1.0
Other congenital malformations of the nervous system	Q01-Q02, Q04-Q07	32	6.6
Congenital malformations of the heart	Q20-Q24	146	30.0
Other congenital malformations of the circulatory system	Q25-Q28	61	12.5
Congenital malformations of the respiratory system	Q30-Q34	16	3.3
Congenital malformations of the digestive system	Q35-Q45	28	5.8
Congenital malformations of the genitourinary system	Q50-Q64	23	4.7
Congenital malformations and deformities of the musculoskeletal system	Q65-Q79	34	7.0
Down's syndrome	Q90	10	2.1
Edwards' syndrome and Patau's syndrome	Q91	22	4.5
Other chromosomal abnormalities, not classified elsewhere	Q92-Q99	7	1.4
Symptoms, signs and abnormal clinical and laboratory findings, not classified elsewhere	R00-R99	92	18.9
Sudden infant death syndrome	R95	57	11.7
External causes of mortality	V01-Y98	31	6.4
Unintentional accidents	V01-X59	26	5.3
Motor vehicle accidents	V02-V04+V09.0+V09.2+ V12-V14+V19.0-V19.2+ V19.4-V19.6+V20-V79+ V80.3-V80.5+V81.0- V81.1+V82.0- V82.1+V83-V86+V87.0- V87.8+V88.8-V88.9+ V89.0-V89.2	8	1.6
Falls	W00-W19	3	0.6
Accidental drowning and submersion	W65-W74	2	0.4
Other accidents obstructing breathing	W75-W84	9	1.8
Accidental poisoning by exposure to noxious substances	X40-X49	0	0.0
Assaults	X85-Y09	4	0.8

Appendix

Source of data on deaths

The information on deaths in residents in Spain comes from the file on deaths by cause of death provided annually by the National Statistical Institute (INE) to the Subdirectorate General of Health Information and Innovation of the Ministry of Health, Social Services and Equality.

The file of deaths by cause of death is based on the information contained in the statistical death bulletin and the statistical birth bulletin that is completed when a death occurs. The former collects data on the deaths of all persons who have lived over 24 hours and the latter on those who died before 24 hours. These statistical bulletins contain information on various demographic, social and health characteristics of the deceased. Furthermore, in the event of the deaths in which the court acts, in addition to the bulletins, another questionnaire recording the external circumstances that caused the injuries should be completed by the examining courts. For this report, the following characteristics that appear in the bulletins were used: age and sex of the deceased, autonomous community of residence, and the basic cause of death.

The process established to collect the data appearing in the file of deaths by cause of death begins when the INE sends the forms for the statistical death and birth bulletins to all civil registry offices. The section of these statistics bulletins on causes of death should be completed and signed by the physician who certifies the death; the rest of the data are indicated by the family members or persons required by law to perform the declaration. The civil registry offices send the completed bulletins to the INE. Since 1983, the INE established collaboration

agreements with the autonomous communities, so that the statistics departments of the communities are those who carry out the tasks of coding the information of the aforementioned bulletins for deaths in their territorial area. The autonomous communities then return to the INE the duly coded information of the bulletins, but before they have incorporated the information they contain on each deceased person to their respective mortality files.

This report analyzed deaths of the population resident in Spain. On one hand, deaths of the entire population by age, sex, and autonomous community of residence were studied, and on the other, deaths in children under 1 year of age for the purpose of obtaining the size and trend of infant mortality. And in both cases, overall deaths and deaths by a list of selected causes of death were analyzed.

Classification of basic cause of death

The cause of death is coded according to International Classification of Diseases and Causes of Death (ICD) of the World Health Organization (WHO). Since 1999, the basic cause of death appearing in statistical death and birth bulletins is coded with the codes from the 10th revision of the ICD, where 21 large groups and 2036 specific categories of causes of death are listed.

Between 1980 and 1998, the 9th revision of the ICD was in force with 17 large groups and 1178 categories of causes of death. And in previous years, previous revisions of the ICD were used. These changes in the classification of causes of death as a result of the revisions of the ICD may lead to changes in mortality trends for some causes of death. Therefore, comparison of causes of death between different revisions of the ICD requires a detailed examination about the code or codes

including the definition of each of the causes of death. Furthermore, a marked change in the mortality trend in the year in which a new ICD has been introduced suggests that there may be problems for comparison of the cause of death under analysis.

In this report, tabulations of the causes of death are based on the basic cause of death. According to the WHO, the basic cause of death is the illness or injury which started the chain of pathological events which directly led to death. When the cause is a traumatic injury, the circumstances of the accident or violence causing the fatal injury is considered the basic cause. The basic cause of death is selected from the various conditions which the physician certifies in the statistical death bulletin. When there are more than one cause or condition certified by the physician, the basic cause is determined by the sequence of conditions appearing in the bulletin, along with a list of rules provided by the ICD for selection of the basic cause.

There are some indicators to assess the quality of the information on the cause of death indicated in the mortality records. One of them is the proportion of deaths that have had to be allocated to groups with ill-defined signs and symptoms. In Spain, deaths for ill-defined causes of death accounted for 2.5% in 2010. In countries of the European Union, this percentage ranges from 0.5% to 5.5%.

Lists of tabulation of causes of death

Most data tables of this report contain the causes of death that caused a greater number of deaths in the entire population. As a result of this, there will be some demographic groups according to age or sex who will not have deaths from any of the selected causes. To select the causes of death that were subject to tabulation, the criteria of

the U.S. Centers for the Disease Control and Prevention were followed.

We studied in a more detailed manner the mortality trend for the 15 causes of death that produced the most deaths. Namely, the information has been available since 2001. The report shows the evolution in the age-adjusted mortality rate due to these causes of death since 1981. As mentioned, between 1981 and 1998 the ICD, 9th revision was used, so it was necessary to select the codes from the ICD, 9th revision that correspond to those 15 causes of death. In any case, with each revision of the ICD there are changes in the classification and for some causes of death those changes may artificially alter the trend. Thus, in some these cases, the mortality trend by cause of death over different periods in which various ICDs have been used should be assessed with prudence.

This report also includes different data tables of deaths in 2010 for 83 selected causes of death. One of these selected causes of death may be formed by a specific category of the ICD or by groupings of specific causes. Furthermore, those 83 selected causes of death are not mutually exclusive of each other, but sometimes a cause of death is a grouping of other causes of death, some of which may appear in the list, but others not.

Codes of causes of death related to tobacco and alcohol

Apart from the aforementioned causes of death, causes of death related to tobacco and alcohol use have been tabulated. The selected causes of death are those proposed by the WHO in the European Health for All Database.

In the case of deaths related to tobacco use, the WHO combines mortality from different causes of death which are known by

the scientific literature to be related to smoking. Specifically, it includes the following codes from the 10th revision of the ICD: C00-C14, malignant neoplasms, lip, oral cavity and pharynx; C32, malignant neoplasm of larynx; C33-C34, malignant neoplasm of trachea, bronchus and lung; C15, malignant neoplasm of esophagus; I20-I25, ischemic heart disease; I60-I69, cerebrovascular diseases; and J40-J47, chronic lower respiratory tract diseases.

Similarly, in the case of deaths related to alcohol use, the WHO combines mortality from different causes of death which are known by the scientific literature to be related to alcohol use. Specifically, it includes the following codes from the 10th revision of the ICD: C15, malignant neoplasm of esophagus; C32, malignant neoplasm of larynx; F10, mental and behavioural disorders due to use of alcohol; K70, alcoholic liver disease; K73-K74, K76, cirrhosis and other chronic diseases of liver; and V00-Y 99, external causes.

These groupings, regardless of the proportion of deaths in each of the causes of death that may be attributed to smoking or alcohol use, are helpful for assessment of the trend of deaths relating to the presence of these risk factors.

Codes of causes of death attributable to tobacco and alcohol

In addition to the causes of death related to tobacco and alcohol use, other causes of death that may be considered attributable to use of these substances were studied. In the case of smoking, was selected deaths from malignant neoplasms of the trachea, bronchus and lung (C33-C34 of the 10th revision of the ICD). According to the scientific literature, 90% of deaths for these causes of death are due to smoking.

In the case of alcohol, the causes of death were selected in which alcohol is explicitly indicated in the name of the cause of death in the 10th revision of the ICD. These are the causes of death they generally do not appear included in epidemiological studies investigating the causes of death associated with alcohol use because their frequency is very low. The codes of the 10th revision of the ICD and causes of death are: E24.4, alcohol-induced pseudo-Cushing's syndrome; F10, mental and behavioural disorders due to use of alcohol; G31.2, degeneration of the nervous system due to alcohol; G62.1, alcoholic polyneuropathy; G72.1, alcoholic myopathy; I42.6, alcoholic cardiomyopathy; K29.2, alcoholic gastritis; K70, alcoholic liver disease; K86.0, alcohol-induced chronic pancreatitis; R78.0, finding of alcohol in blood; X45, accidental poisoning by alcohol; X65, self-inflicted intentional poisoning by alcohol and Y15, poisoning by alcohol of undetermined intent.

In theory, deaths attributable to tobacco and deaths attributable to alcohol must provide a more sensitive indicator of the trend of causes of death associated with these risk factors.

Codes of causes of death related to the quality of the health system

Some causes of death may be used to assess the quality of health services. In this report the causes that appear in the WHO European Health for All Database were chosen. Specifically, they are appendicitis (code K35-K38 of the 10th revision off the ICD), hernia, and intestinal obstruction (code K40-K46 and K56) and adverse effects of medicinal products and other therapeutic agents (code Y40-Y59).

Infant mortality

Infant mortality rates are the most widely used indicator to measure the risk of mortality in the first year of life. The rates presented in this report are calculated by dividing the number of infant deaths in each year by the number of live births in the same year. The rates are presented by 1000 live births or by 100,000 live births. The information on the number of births each year was obtained from the file of births provided by the INE. The information on births is obtained from the statistical birth bulletin, which after being completed by parents or family members and by health professionals, is sent by the civil registry offices to the INE. This report provides the trend in infant mortality since 1981.

It should be kept in mind that in the tables in which mortality rates are presented according to age of the deceased, the rates in children under one year of age are shown. These rates may not agree with the infant mortality rate. While the denominator for infant mortality rates is based on live births each year, the denominator of mortality in children under one year of age is comprised by the population of children under 1 estimated at 1st July of each year.

List of tabulation of causes of death in children under 1

The data table on causes of death in children of this report contain the causes of death that produced a greater number of deaths in children under one year of age. To select the causes of death that were subject to tabulation, the criteria of the U.S. Centers for the Disease Control and Prevention were followed.

We studied in a more detailed manner the mortality trend for the 10 causes of

death that produced the most deaths. Namely, the information has been available since 2001. And, on the other hand, different data tables were prepared with the deaths in 2010 for 59 selected causes of death. One of these selected causes of death may be formed by a specific category of the ICD or by groupings of specific causes. Furthermore, those 59 selected causes of death are not mutually exclusive of each other, but sometimes a cause of death is a grouping of other causes of death, some of which may appear in the list, but others not.

Source of data on population

The populations used for calculation of mortality rates come from Spanish Population Projections for the period 1980-2010 from the 1981 Population Census (years 1981 to 1990), from the Spanish Population Projections calculated from the 1991 Population Census (from 1991 to 2001) and from the Current Population Estimates (from 2002 to 2010), all of them prepared by the INE. In all cases, data refer to the population at 1st July of each year. The table of the appendix shows the populations used.

In the population projections, the number of subjects by sex and age resulting in each census are used as the baseline population. In turn, the populations estimated in the projection are compared later to those obtained in the relevant census. The differences between the calculated and observed populations causes breaks in population series, which makes it necessary to link or to correct the projections established in accordance with the results of successive censuses, that is, they require that intercensal population estimates be obtained.

Whereas for the estimates on the current population, the baseline population

was taken from the 2001 Census on Population and Households. The estimate of the parameters on evolution of fertility and mortality available from definitive results of the Natural Population Movement and for adjusting migratory movements of each period, the migrations estimated from the movements in the Continuous Register of Inhabitants are used.

Calculation of mortality rates

Except for infant mortality rates, mortality rates were calculated by taking as the numerator the number of deaths in the respective year and as the denominator the population at 1st July of that year. The result is expressed per 100,000 population in each group analyzed. As noted, the infant mortality rates are per 1,000 or 100,000 live births.

Age distribution of the population varies from one year to the next and age distribution is also different between autonomous communities. Furthermore, the age distribution of the population is different in men from women. In fact, there is a greater proportion of women in advanced ages which are precisely the ages where there is a greater risk of mortality. Thus, comparison over time of the mortality rate in the entire country, comparison of the mortality rate among autonomous communities, or comparison of the mortality rate among men and women, without adjusting for the different age structure, offers distorted results of the real differences in the risk of mortality. On the other hand, the age-adjusted death mortality rate allows us to compare mortality among the different populations under study, because it eliminates distortion resulting from the different age structure in the comparison.

The age-adjusted mortality rate in each group is simply a weighted mean of the specific mortality rates by age, where the weighting is determined by the size of the standard population in each age category. The age-adjusted mortality rates in this report were estimated using the age distribution of the European standard population (Waterhouse JAH, Muir CS, Correa P, Powell J eds. *Incident cancer in five continents*. Lyon: IARC, 1976; 3: 456.). This population is as follows:

Age	Population
1	1,600
1-4	6,400
5-9	7,000
10-14	7,000
15-19	7,000
20-24	7,000
25-29	7,000
30-34	7,000
35-39	7,000
40-44	7,000
45-49	7,000
50-54	7,000
55-59	6,000
60-64	5,000
65-69	4,000
70-74	3,000
75-79	2,000
80-84	1,000
85 and over	1,000

If T_i is the mortality rate per 100,000 population in the age category i in a given population group and P_i is the size of the standard population in age category i , the age-adjusted mortality rate in that group is $\sum T_i P_i / \sum P_i$.
